## Digital Semiconductor SA-110 Microprocessor for Portable Applications Product Brief

The Digital Semiconductor SA-110 Microprocessor (SA-110), the first member of the StrongARM family of high-performance, low-power microprocessors, is optimized for embedded consumer applications. Featuring superior power efficiency, low cost, and the highest performance in the industry, the SA-110 is an ideal solution for PDAs, advanced mobile phones, and other emerging consumer applications. In addition to delivering unparalleled performance in a low-power design, the SA-110 offers compatibility with existing ARM development tools and operating systems.

### Applications

- Portable products
  - Personal digital assistants (PDAs)
  - Smart phones
  - Digital cameras
  - Organizers
  - Bar-code scanners
  - Handheld personal computers (HPCs)

### Operating Systems

- Apple Computer, Inc. – Newton OS
- Microware – OS9
- Psion – EPOC32 OS
- Sun Microsystems, Inc. – Java
- WindRiver – VxWorks

### Benefits

- Unparalleled performance in a low-power design enables new and advanced personal digital assistant (PDA), mobile phone, and other smart handheld devices.
- Industry-leading price performance ideal for any mobile product that demands low power and small footprint.
- Small feature size reduces capacitance, saving power consumption.
- Compatibility with ARM and the availability of key third-party development tools (RTOS) reduces design efforts and cost.
- Complete suite of software and hardware tools speeds time to market.

### Description

The SA-110 is a general-purpose, 32-bit RISC microprocessor with a 16KB instruction cache (Icache); a 16KB write-back data cache (Dcache); a write buffer; and a memory-management unit (MMU) combined in a single chip. The five-stage pipeline distributes tasks evenly over time to remove bottlenecks, ensuring high throughput for the core logic. The SA-110 offers high-level RISC performance, yet it provides minimal power consumption, making it ideal for portable, low-cost systems. The SA-110 onchip MMU supports a conventional two-level page-table structure, with a number of extensions. These features result in a high instruction throughput and impressive real-time response for a small and cost-effective chip.

## Features

- High performance
  - 115 Dhrystone 2.1 MIPS @ 100 MHz
  - 185 Dhrystone 2.1 MIPS @ 160 MHz
- Low power (normal mode)
  - 130 mW @ 1.65-V/100-MHz core/27-MHz bus
  - 170 mW @ 1.65-V/160-MHz core/33-MHz bus
- Internal phase-locked loop (PLL)
  - 3.68- or 3.56-MHz external reference oscillator
- Idle and sleep power-down modes
- Big and little endian operating modes
- 3.3-V I/O interface
- 144-pin thin quad flat pack (TQFP)
- 32-way set-associative caches
  - 16KB instruction cache
  - 16KB write-back data cache
- 32-entry MMUs
  - Maps 4KB, 64KB, or 1MB
- Write buffer
  - 8-entry, 16 bytes each
- Memory bus
  - Asynchronous or synchronous
  - 0-33 MHz @ 100 MHz
  - 0-53 MHz @ 160 MHz

## Microarchitecture

The SA-110 microprocessor is a high-performance implementation of Advanced RISC Machine's ARM Version 4 architecture specification. Figure 1 shows a block diagram of the SA-110.

### Bus Interface Logic

The bus interface logic, consisting of the control logic and the address register, controls the bus interface and unplanned events such as interrupts, resets, and aborts. The bus interface logic can also enable or disable wrapping of read transactions and merging of write transactions.

The bus interface can be configured to run synchronously or asynchronously to the core logic. In synchronous mode, the bus interface clock speed is the core clock rate divided by a programmable integer value from 2 to 9 (maximum of 66 MHz).

### Write Buffer

The SA-110 has an 8-entry write buffer with each entry able to contain 1 byte to 16 bytes. The write buffer can be enabled or disabled by software. The write buffer is further controlled by a bit in the MMU page tables; so the MMU must be enabled before the write buffer can be used. Software can cause the write buffer to be flushed.

### Core Logic

The core logic fetches and executes instructions by using a five-stage pipeline. The five stages are: fetch, decode, arithmetic logic unit (ALU), cache, and write-back. This pipeline arrangement, using the onchip ALU, distributes tasks evenly in time and, therefore, contributes to the high performance of the core logic.

The ARM architecture supports 30 general-purpose registers, 1 program counter, and 6 status registers. There are 16 general-purpose registers (including the PC register) and 1 or 2 status registers visible at any one time. The processor operating mode determines which registers are visible.

The core logic executes the ARM instruction set, which supports straight-forward assembly language code programming. It does not depend upon sophisticated compilers to manage complicated instruction interdependence.

The instruction set has eight instruction classes:

- Two instruction classes use the onchip ALU, barrel shifter, and multiplier to perform high-speed operations on the data in a bank of 16 logical (31 physical) 32-bit registers.
- Three instruction classes control data transfer between memory and the registers. The classes are optimized for flexible addressing, rapid context switching, and swapping data.
- Two instruction classes control execution flow and execution privilege level.
- One instruction class accesses the privileged state of the SA-110.

The core logic implements 32-bit virtual addresses and 32-bit physical addresses. A 12-bit multiplier with early termination performs multiplication. The number of cycles needed to perform a multiplication operation depends on the magnitude of the operands, as shown in Table 1.

### Core Logic Multiplication Functions

Multiplication Operation (Signed or Unsigned)	Result Size	Operation Duration
32 x 32	32 bits	2–4 cycles
32 x 32 + 32	32 bits	2–4 cycles
32 x 32	64 bits	3–5 cycles
32 x 32 + 64	64 bits	3–5 cycles

### Memory-Management Units

The SA-110 has two MMUs: instruction (IMMU) and data (DMMU). Separate translation lookaside buffers (TLBs) are implemented for the instruction and data streams. The TLBs each have 32 entries that can each map a segment, a large page, or a small page. The TLB entry replacement algorithm is round-robin. The data TLB supports both the flush-all and the flush-single-entry function, while the instruction TLB supports only the flush-all function. Memory-management exceptions preserve the base address registers, eliminating the need for “fix-up” code.

### Cache

The SA-110 has a 16KB, 32-way, set-associative Icache with 32-byte blocks and a 16KB, 32-way, set-associative, write-back Dcache with 32-byte blocks.

### Instruction Cache

The Icache supports the flush-all-entry function, and the replacement algorithm

is round-robin within a set. The Icache can be enabled or disabled independent of the memory-management function. When memory management is disabled, the Icache control logic considers all memory to be cacheable.

### Data Cache

The write-back Dcache supports the flush-all-entry, flush-entry, and copyback-entry functions. The copyback-all function is not provided in hardware but can be provided by software. The Dcache entries are allocated with read transactions and the entry replacement logic uses a round-robin algorithm.

### Clocks

The SA-110 receives a 3.68-MHz clock from a crystal-based clock generator. The SA-110 uses an internal PLL to multiply the frequency by a variable multiplier to produce a high-speed clock. The high-speed clock is then divided internally by a configurable ratio to provide a system clock for synchronous operation. The 3.68-MHz oscillator and PLL run constantly in normal and idle mode.

### Boundary-Scan Test Logic

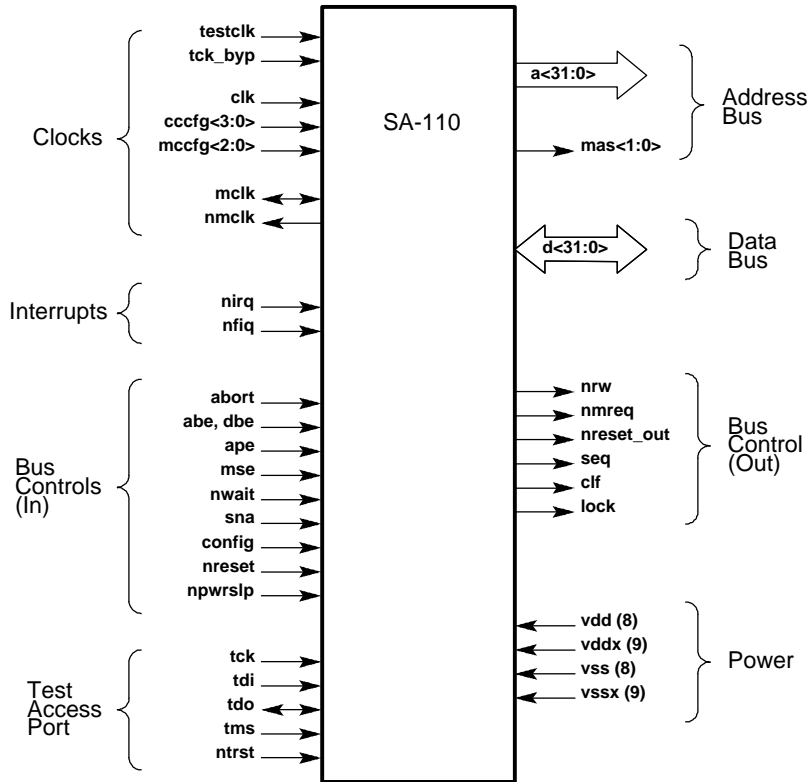

The SA-110 boundary-scan interface provides for driving and sampling of all the external pins of the device except **npwrslp**, irrespective of the core logic state. This ability permits testing of:

- SA-110 electrical connections to the circuit board.
- Integrity of connections between devices having a similar interface on the circuit board.

### Signal Lines

Figure 2 shows the signal connects to and from the SA-110. The signals are arranged within functional groups.
